

May 26, 2016 The realtek rtl8188cuchip consists of the following four modules. We keep the biggest module and choose the SoC register of it to explain the mechanism of the largest module. For the module of 8188 in 16mm, we first explain the module of 8188 in 2mm. We also explain the mechanism of the 8188 module in the future. The SoC register of 8188 consists of the following eight modules. The 8188 module is a microcontroller unit. A microcontroller consists of hundreds of similar chips called functional units, memory units, and I/O units. Each chip has its own register. If you want to obtain a register value, you must read this chip's register first, then you can obtain the register value. The eight modules are described as follows. 1) Register name:8188 -0x01FF 2) The contents of the register are described in section 2.5 3) Registers description 4) Registers description 5) Registers description 6) Registers description 7) Registers description 8) Registers description 9) Registers description 10) Registers description 11) Registers description 12) Registers description We select the first 8 of the 16 registers of the 8188 chip to describe its whole mechanism. The 16 registers of the 8188 chip can be divided into two groups. The first group consists of the first 8 registers, and the second group consists of the remaining 8 registers. The first group is called the general registers, and the second group is called the special registers. We select the first 8 registers of the general group to describe the function of the 8188 chip. The function of the 8188 chip is the network chip. 1)Registers description 2)Registers description 3)Registers description 4)Registers description 5)Registers description 6)Registers description 7)Registers description 8)Registers description 2.1. Interface Unit 2.2. Receiving Unit 2.3. Transmitting Unit 2.4. Image Processing Unit 2.5. The following functions can be performed by the 8188 Registers 2.5.1. Miscellaneous functions 2.5.2. Interrupt Handling
